

# Operating Room Dashboard

Is your operating room (OR) a major profit center, or a substantial drain on your budget? Health Care DataWorks' Operating Room dashboard presents the information about the performance efficiencies of an operating room that you want to know and track.

The Operating Room dashboard provides valuable feedback to help drive strategic and tactical decisions. The power of the dashboard is in its interactivity; each chart supports drill-down reports that can be activated with a mouse click.

For example, the 'Room Entry to Incision Time' report can "drill down" to show how that metric performed by department, by procedure, or even by a particular surgeon. In this way, drill-downs can help find which entities are responsible for variations in performance on an aggregated metric.

## 14 Distinct Indicators Include:

- OR Volume
- Room Entry to Incision Time
- Percent First Case Delays
- Antibiotic On Time
- Average Rooms Running
- OR Utilization
- OR Case Length Deviation
- OR Hours

Each metric can be viewed as part of a total picture, or brought into focus to identify your "star performers". In addition, underperforming sections of the operating room can be identified. Wouldn't you like to know:

- Which surgeon costs the most during surgery?
- Where are the bottlenecks?
- Who's trying to "beat the system"?

## Value:

HCD's OR Dashboard can be quickly implemented to provide immediate value to end users. When adopted as part of HCD's Enterprise Data Warehouse Appliance, Analysts also have the ability to do ad hoc analysis across Clinical, Financial, and Operational areas, providing an enterprise view of your data.
